

# FOOD ORDERING SYSTEM

# INTRODUCTION

The FOOD ORDERING SYSTEM has been developed to override the problems prevailing in practicing manual system. This software is supported to eliminate and in some cases reduce the hardships faced by this existing system. This system is designed for the particular need of a company to carry out operations in a smooth and effective manner.

This project is reduced as much as possible to avoid errors while entering the data. It also provides error message while entering invalid data. No formal knowledge is needed for the user to use this system. Thus by this it proves that it is user friendly. It can assist the user to concentrate on their other activities rather to concentrate on their record keeping.

Every organisation, whether big or small has challenges to overcome and managing the information of category, food item, order, payment, confirm order. This is designed to assist in strategic planning, and will help you ensure that your organisation is equipped with right level of information and details.

# ABSTRACT

- ❑ The purpose of food ordering system is to automate the existing manual system by the help of computerized equipments and full fledged computer softwares, fulfilling their requirements so that their valuable information can be stored for longer period with easy access.
- ❑ This project, can lead to error free, secure, reliable and fast management system. Thus it will help organization in better utilization of resources. The organization can maintain computerized records without redundant entries.
- ❑ Basically the project describes how to manage for good performance and better services for the clients

# ACKNOWLEDGEMENT

- I express my sincere regard to my Data structure teacher Divya shree ma 'am for giving a wonderful opportunity and her valuable time, guidance, encouragement, support and cooperation throughout the project
- This project helped in understanding the various data structures which are involved in building this project

# APPLICATIONS

- ❑ Food ordering system is used in every

# DATA STRUCTURE USED

1. LINKED LIST
2. ARRAY

## LINKED LIST

Linked list is a linear data structure which is used to maintain a list in the memory. It can be seen as the collection of nodes stored at non-contiguous memory locations. Each node of the list contains a pointer to its adjacent node

## ARRAY

An array is a collection of similar type of data items and each data item is called an element of the array. The data type of the element may be any value data type like char, float, int or double

# Linked List

- ❑ To store the food items available in restaurant along with their price.
- ❑ To display the selected food items ordered by user to the client.
- ❑ To generate the bill.

# ARRAY

- 1.To calculate the total amount to be paid by the customer
